Lec-2 Dart - Standard input /o/p

• dart:io Package : The dart:io is one of the many packages of the dart library. It contains functions/meth related to taking input / display output to the console, for the user.

* Standard input : To take standard input of the user from the console, we have the readLineSync () method,
→ This method belongs to the stdin class.
→ This class contains many other methods, related to taking user input.

* Standard output : There are two ways to handle output in dart
i) Using Print Statement
ii) Using Stdout·write () [Again write() is a method of the Stdout class which is present in the "dart:io" Package.]

Print Statement : It takes a single argument, i.e an object and Prints.

Note : To use stdin· readLineSync () or Stdout· write, we need to import 'dart:io'.
